

CROSS DOMAIN SECURITY INFORMATION CONVERSION

5

ABSTRACT

Methods, systems, and computer program products are provided for cross domain security information conversion. Embodiments include receiving from a system
10 entity, in a security service, security information in a native format of a first security domain regarding a system entity having an identity in at least one security domain; translating the security information to a canonical format for security information; transforming the security information in the canonical format using a predefined mapping from the first security domain to a second security domain; translating the
15 transformed security information in the canonical format to a native format of the second security domain; and returning to the system entity the security information in the native format of the second security domain.
